**Supplementary Fig. 1.** Nomogram predicting the probability of death on the wards after ICU discharge. Instructions: Please draw a line straight upward to the point axis to determine how many points the patients receive for each variable. Then, sum up all scores to receive total points. Locate the final sum on the total point axis and draw a line straight down to find the patient’s probability of death after ICU discharge.

ICU = intensive care unit, Hb = hemoglobin, Plt = platelet counts, SOFAadm = Sequential Organ Failure Assessment score upon ICU admission.
